

SESSION 3 - HTML FORMS ASSIGNMENT

Contents
1. Task 1 - Flipkart Product Review Form
2. Task 2 - HTML5 Validation
3. Task 3 - POST Method & DevTools Network
4. Task 4 - Zomato Food Order Form
5. Task 5 - Disabled Order ID
6. Conclusion

Task 1

Question

Create an HTML form for a Flipkart-style product review with Username, Rating (1–5 dropdown), and Review Message.

Objective

To design a simple and user-friendly product review form using HTML form elements.

Explanation

The form contains labels, a text input for username, a dropdown list for rating, a textarea for review message, and a submit button. Labels improve accessibility while form controls collect user feedback.

HTML Element	Purpose
<form>	Creates the review form
<label>	Displays field labels
<input type='text'>	Accepts username
<select>	Allows rating selection
<textarea>	Accepts review message
<button>	Submits the form

Main Source Code: Attach the corresponding HTML file below this section in your assignment.

Task 2

Question

Add HTML5 validation attributes so username is required, rating must be selected, and review message must contain at least 20 characters.

Objective

To validate user input before form submission.

Explanation

The 'required' attribute makes fields mandatory. The 'minlength' attribute ensures the review contains at least 20 characters. A disabled default option in the dropdown forces the user to select a valid rating.

HTML Element	Purpose
required	Makes input mandatory
minlength	Sets minimum text length
disabled selected	Prevents default option submission

Main Source Code: Attach the corresponding HTML file below this section in your assignment.

Task 3

Question

Modify the form to use POST method and inspect submitted data in Chrome DevTools.

Objective

To understand how HTML forms send data using the POST method.

Explanation

After changing the method to POST, open Chrome Developer Tools (F12), select the Network tab, submit the form, open the request, and inspect the Payload/Form Data section to view the submitted values.

Main Source Code: Attach the corresponding HTML file below this section in your assignment.

Task 4

Question

Build a Zomato-style food order form with username, food item, quantity, and delivery instructions.

Objective

To create a food ordering form using different HTML input controls.

Explanation

The form uses a text input, dropdown menu, number input, textarea, and submit button. Required validation ensures users complete all fields before placing an order.

HTML Element	Purpose
Username	Customer Name
Food Item	Select food
Quantity	Number of items
Delivery Instructions	Additional delivery notes

Main Source Code: Attach the corresponding HTML file below this section in your assignment.

Task 5

Question

Add a disabled input field displaying Order ID (ORD12345).

Objective

To display a fixed Order ID that users cannot modify.

Explanation

The disabled attribute prevents users from editing the Order ID because it is automatically generated by the system. This helps maintain data integrity and prevents accidental changes.

HTML Element	Purpose
disabled	Makes the Order ID read-only for users

Main Source Code: Attach the corresponding HTML file below this section in your assignment.

Conclusion

In this session, HTML forms were created for product reviews and food ordering. HTML5 validation attributes such as required, minlength, and disabled were implemented successfully. The POST method and Chrome DevTools Network tab were also used to understand how form data is submitted.
